

RADIOLOGY SERVICES IN GRAND LEDGE

McLaren Greater Lansing Grand Ledge Radiology is dedicated to providing excellent primary health care services to all ages in the surrounding area. We offer a variety of diagnostic imaging services, including X-rays, digital mammography, ultrasound, and bone density screening.

Bone Density Scan

A bone density test (also known as bone mass measurement), measures the strength and density of the bones to help prevent or diagnose fractures.

3D Mammography

3D mammography (tomosynthesis) is a revolutionary screening and diagnostic tool designed for early detection of breast cancer.

Breast Ultrasound

A breast ultrasound is often used to examine a suspected change when a mammogram shows dense breast tissues.

Ultrasound

An ultrasound exam, or sonogram, is a safe and generally noninvasive procedure that utilizes high-frequency sound waves to image an internal body structure.

X-Ray

An X-ray (radiograph) is an exam that helps physicians diagnose and treat medical conditions and is the oldest form of medical imaging.
