Patient Success Stories

Evelyn, who is in her early 70's, was experiencing leakage for two years before she found out about physical therapy as a treatment option. She was able to stop taking the incontinence medication after a couple of weeks of therapy and now drinks caffeine without problems.

"Many women do not like to discuss this problem, but I never felt uncomfortable talking with her, even from the beginning. She gave me exercise techniques to do as the size I could take them on. She never rushed me."

Tammy suffered for over a decade with vaginismus, a condition that makes routine pelvic exams and intercourse very painful or in severe cases, impossible.

"It was the nurse practitioner at my primary care doctor's office that introduced me to physical therapy as a treatment option. It was not even two months of going to physical therapy that I was able to have intercourse with my husband without pain for the first time in ten years."

Don't Be a Statistic

- > Urinary incontinence affects about 25 million adults; 75-80% of these are women.
- > Women wait an average of six years to seek treatment for their pelvic floor problems.
- > 2/3 of women 30-70 years old have never discussed bladder health with their doctor.
- > For men, estimates of incontinence after prostatectomy range from 25-70%.
- > The overall lifetime prevalence for chronic pelvic pain is estimated to be 9-16% for men and 24% for women.

The good news is incontinence and pelvic pain do not have to be a normal part of life and can be successfully treated with physical therapy.

Pelvic Health Therapy Locations

Pelvic Floor Rehabilitation

"I want people to know they are not alone, and it's not something that they have to live with."
 Tammy - Grand Blanc
