

# MCLAREN GRAND LEDGE IMAGING OFFERS 3D MAMMOGRAPHY

Breast Tomosynthesis, often referred to as 3D or three dimensional mammography is a revolutionary breakthrough in breast cancer detection. It enables the radiologist to see breast detail as never before possible. Through clinical studies, tomosynthesis has proved to be superior to conventional digital mammography alone, improving breast cancer detection by nearly 40%.

Digital mammography with 3D imaging is recommended for all women, but is especially helpful for patients with the following:

- Baseline (first) mammogram
- History of breast cancer
- Dense breast tissue
- Diagnostic mammogram (an area of concern has been found upon physical examination)
- Medical history that puts you in a high risk category for developing breast cancer

Any patient can request digital mammography with 3D imaging, but please be advised that some insurance carriers may not cover the 3D portion of the exam. To verify 3D coverage with your insurance company, please contact them and provide **CPT code 77063**.

Thank you for choosing McLaren Greater Lansing Grand Ledge Imaging for your breast care needs.
