

McLaren Print System Order

Order No: 84970
 Order Date: 2024-04-26
 User: Sherry Farney
 Phone: 810-342-4477

Ship Location: Sherry Farney-McLaren Flint Marketing Dept-Ground Floor
 401 S. Ballenger Hwy.
 Flint, MI 48532

Brochures
 Quantity: 50
 Paragon Dept No: 17805
 Dept Name: Marketing
 Company Number: 10

Order Total Price: 17.05

Item Number: M-210
 Item Description: ROBOTIC SURGERY PROGRAM Flyer
 Revision Date: 04/2024
 Print:
 Paper:
 Size:
 Fold:
 Finish:
 Drill:
 Poster:
 Misc Info: 8.x11, SS, Color, Bleed, 80# Offset

ROBOTIC SURGERY PROGRAM

LEADERS IN MINIMALLY INVASIVE PROCEDURES

McLaren Flint began offering robotic surgical procedures in 2008 making it the first area hospital to do so. The program continues to grow, and patients can now benefit from nearly 30 different robotic procedures.

Why Robotic?

For patients, robotic surgery means smaller incisions, less pain, less risk of infection, quicker recoveries, less scarring, reduced blood loss and transfusions, and a quicker return to daily activities. For surgeons, the robotic technology used for non-orthopedic procedures has an enhanced high-resolution three-dimensional imaging system which allows surgeons to perform delicate procedures with a greater range of motion, control, and precision. Orthopedic MIRA® robotic arm assisted surgery uses CT based 3D modeling of bone anatomy to create a personalized surgical plan based on each patient's unique anatomy. The technology continues to provide enhanced sight inside of the body, better dexterity, and more options for patients, with fewer complications.

ROBOTIC-ASSISTED PROCEDURES

Colorectal

- Improved cancer margins
- Less chance of surgeon converting to open surgery

Urology

- Prostatectomy - surgical removal of the prostate gland offers numerous benefits over open prostatectomy
- Nephrectomy - surgical removal of one or both kidneys
- Pyeloplasty - surgical reconnection of the connection of the ureter to the kidney
- Nephroureterectomy - surgical removal of a kidney and its ureter
- Varicocelectomy - surgery to remove enlarged veins to restore blood flow to the male reproductive system
- Ureter repair

Gynecology

- Chry and tubal lute removal
- Sacrocolpopexy - a complex procedure to correct pelvic prolapse. The robotic procedure is the gold standard for this type of surgery
- Myomectomy - removal of fibroids or tumors from the

uterus that maintains the patient's ability to become pregnant.

- Staging for gynecologic cancers
- Resection of ovarian/ovarian mass
- Hysterectomy-removal of the uterus and cervix

Orthopedics

Minimally Invasive Surgery (MIRA®)

By selectively targeting the damaged cartilage, the surgeon can spare the healthy bone and ligaments surrounding the arthritic portion of the joint. Robotic arm assisted technology provides the surgeon a patient specific 3-D model to pre plan the joint replacement. During the procedure, tactile, visual, auditory feedback, and real-time data assists the surgeon in positioning the replacement and placing the implants in the desired orientation with more accuracy. This technology is used for:

- Total hip replacement
- Total knee replacement
- Partial knee replacement

Oncology

- Resection of liver anterior colon
- Hemicolectomy-removal of large intestine
- Resection abdominoparietal

- Resection of liver
- Laparoscopy
- Trans and resection of rectal mass
- Whipple-like tumors and other conditions in small intestine, pancreas, and bile ducts
- Colectomy-removal of all parts of the stomach
- Esophagectomy-removal of part or all of the esophagus
- Splenectomy-removal of spleen
- Adrenalectomy-removal of adrenal gland if it is cancerous and/or producing too much hormone
- Pancreatectomy-removal of part or all of the pancreas
- Rectopexy/fixation a rectal prolapse
- Repair rectal prolapse

General

- Cholecystectomy
- Hernia
- Ovary

Thoracic

- Lobectomy
- Lymph node biopsy
- Mediastinal Tumor resection
- Diaphragmatic and Hilar Tumor resection
- Esophageal resection/oesoph.
